DENY DOUBLE LOGIN-RANDOM NUMBER PHP

rand(a,b)

a and b is the start and end of random number...
rand (100,200)   will get a random number between 100 and 200...
the random number is usefull so you can store it to database and recheck
the user at each request that required authentication....
login->store that random number into database of user-> check the number
you got at each request that needs authentication->
when someone else try to login with same account it will give a new
number in database so when the old account does a new request
it will get a different number and will get kicked out..).
